

## Bundled Payments for Care Improvement (BPCI) Advanced Annual Check-in Questionnaire

[illegible]

1

1

### Purpose:

Participants' activities and barriers related to designing and implementing the BPCI Advanced Model

1

### Instructions:

The first part of the study was a pilot study. The purpose of the pilot study was to determine the feasibility of the study and to estimate the sample size required for the main study. The pilot study was conducted with 10 participants. The results of the pilot study showed that the study was feasible and that the sample size required for the main study was 100 participants.

The main study was conducted with 100 participants. The participants were recruited from a variety of sources, including social media, community organizations, and university databases. The participants were randomly assigned to two groups: the experimental group and the control group. The experimental group received the intervention, while the control group did not receive the intervention.

The intervention was a 12-week program that focused on improving the participants' understanding of the risks of smoking and the benefits of quitting. The intervention was delivered through a combination of group sessions and individual counseling. The group sessions were led by a trained facilitator, and the individual counseling was provided by a research assistant.

The control group received no intervention. The participants in the control group were asked to continue with their current smoking habits. The participants in the experimental group were asked to quit smoking during the 12-week intervention period.

The primary outcome of the study was the number of participants who quit smoking during the 12-week intervention period. The secondary outcomes were the number of participants who reported a reduction in the number of cigarettes smoked per day and the number of participants who reported a reduction in the number of times they smoked per day.

The results of the study showed that the intervention was effective in helping participants quit smoking. The number of participants who quit smoking during the 12-week intervention period was significantly higher than the number of participants who quit smoking in the control group.

The results also showed that the intervention was effective in helping participants reduce the number of cigarettes smoked per day and the number of times they smoked per day. The number of participants who reported a reduction in the number of cigarettes smoked per day and the number of participants who reported a reduction in the number of times they smoked per day was significantly higher in the experimental group than in the control group.

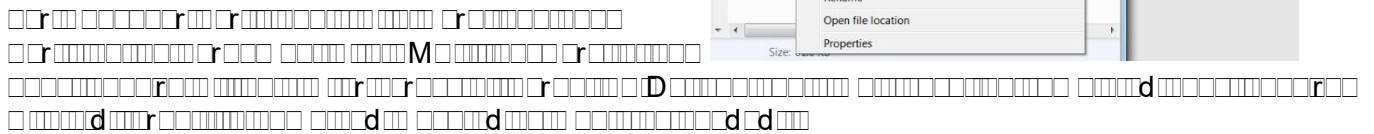

The study has several limitations. First, the study was a pilot study, and the sample size was small. Second, the study was conducted over a short period of time, and the long-term effects of the intervention are unknown. Third, the study did not include a measure of the cost of the intervention.

Despite these limitations, the study provides promising results for the use of the intervention to help people quit smoking. Further research is needed to confirm the findings of this study and to determine the long-term effects of the intervention.

Diagram illustrating the location of the *rDNA* and *rD* genes on the *E. coli* chromosome. The *rDNA* gene is located at approximately 100 minutes, and the *rD* gene is located at approximately 110 minutes. The *rDNA* gene is transcribed into rRNA, and the *rD* gene is transcribed into 16S and 23S rRNA.

## Partner Agreements

1. **Definition:** A **Decision Tree** is a model for classification and regression tasks. It consists of a root node, internal nodes, and leaf nodes. The root node branches into internal nodes, which further branch into leaf nodes. The leaf nodes represent the final classification or regression result.

The diagram illustrates three rows of boxes, each containing a letter (r or d) or being empty. The top row contains 28 boxes with the sequence: r, [empty]. The middle row contains 28 boxes with the sequence: r, [empty]. The bottom row contains 10 boxes with the sequence: d, d, [empty], [empty], [empty], [empty], [empty], [empty], [empty], [empty].
