

## Bundled Payments for Care Improvement (BPCI) Advanced Annual Check-in Questionnaire

[illegible]

1

1

### Purpose:

Participants' activities and barriers related to designing and implementing the BPCI Advanced Model

**Instructions:**

The first part of the study was a pilot study. The purpose of the pilot study was to determine the feasibility of the study and to estimate the sample size required for the main study. The pilot study was conducted with 10 participants. The results of the pilot study showed that the study was feasible and that the sample size required for the main study was 100 participants.

The main study was conducted with 100 participants. The participants were recruited from a local community center. The participants were randomly assigned to two groups: the experimental group and the control group. The experimental group received the intervention, and the control group did not receive the intervention. The intervention was a 12-week program of physical activity. The participants in the experimental group were asked to participate in the program for 12 weeks. The participants in the control group were asked to participate in the program for 12 weeks. The participants in the experimental group were asked to participate in the program for 12 weeks. The participants in the control group were asked to participate in the program for 12 weeks.

The results of the study showed that the intervention was effective. The participants in the experimental group showed a significant improvement in physical activity levels compared to the participants in the control group. The results of the study also showed that the intervention was feasible. The participants in the experimental group were able to participate in the program for 12 weeks.

The study has several limitations. The first limitation is that the study was a pilot study. The second limitation is that the study was conducted with a small sample size. The third limitation is that the study was conducted with a single group of participants.

The study has several strengths. The first strength is that the study was a pilot study. The second strength is that the study was conducted with a large sample size. The third strength is that the study was conducted with two groups of participants.

The study has several implications. The first implication is that the intervention is effective. The second implication is that the intervention is feasible. The third implication is that the intervention is acceptable.

The study has several conclusions. The first conclusion is that the intervention is effective. The second conclusion is that the intervention is feasible. The third conclusion is that the intervention is acceptable.

## Partner Agreements

1. **Definition:** A **Decision Tree** is a model for classification and regression tasks. It consists of a root node, internal nodes, and leaf nodes. The root node branches into internal nodes, which further branch into leaf nodes. The leaf nodes represent the final classification or regression result.
