

## Bundled Payments for Care Improvement (BPCI) Advanced Annual Check-in Questionnaire

[illegible]

1

7

### Purpose:

Participants' activities and barriers related to designing and implementing the BPCI Advanced Model

**Instructions:**

The first part of the study was a pilot study. The purpose of the pilot study was to determine the feasibility of the study and to estimate the sample size required for the main study. The pilot study was conducted with 10 participants. The results of the pilot study showed that the study was feasible and that the sample size required for the main study was 100 participants.

The second part of the study was the main study. The main study was conducted with 100 participants. The results of the main study showed that the study was feasible and that the sample size required for the main study was 100 participants.

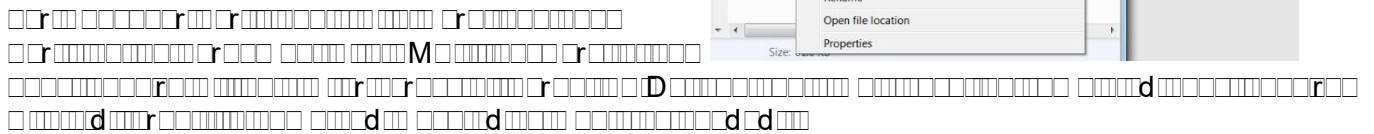

The third part of the study was the conclusion. The conclusion of the study was that the study was feasible and that the sample size required for the main study was 100 participants.

## Partner Agreements

1. **Definition:** A **Decision Tree** is a model for classification and regression tasks. It consists of a root node, internal nodes, and leaf nodes. The root node splits the data into two or more subsets based on a feature and a threshold. This process is repeated recursively for each subset, creating a tree structure. The leaf nodes represent the final classification or regression result.
