

## Bundled Payments for Care Improvement (BPCI) Advanced Annual Check-in Questionnaire

[illegible]

1

7

### Purpose:

Participants' activities and barriers related to designing and implementing the BPCI Advanced Model

### Instructions:

The first part of the study was a pilot study. The purpose of the pilot study was to determine the feasibility of the study and to estimate the sample size required for the main study. The pilot study was conducted with 10 participants. The results of the pilot study showed that the study was feasible and that the sample size required for the main study was 100 participants.

The main study was conducted with 100 participants. The participants were recruited from a variety of sources, including social media, community organizations, and university databases. The participants were randomly assigned to two groups: the experimental group and the control group. The experimental group received the intervention, while the control group did not receive the intervention.

The intervention was a 12-week program that focused on improving the participants' understanding of the risks and benefits of the intervention. The intervention was delivered through a series of workshops and group discussions. The control group received no intervention.

The primary outcome of the study was the change in the participants' understanding of the risks and benefits of the intervention. The secondary outcomes were the participants' attitudes towards the intervention and their willingness to participate in the intervention.

The results of the study showed that the intervention significantly improved the participants' understanding of the risks and benefits of the intervention. The participants in the experimental group also had more positive attitudes towards the intervention and were more willing to participate in the intervention than the participants in the control group.

The study has several limitations. First, the study was a pilot study and the sample size was small. Second, the study was conducted in a community setting and the results may not be generalizable to other settings. Third, the study did not measure the long-term effects of the intervention.

Despite these limitations, the study provides valuable information about the feasibility of the intervention and the potential for improving the participants' understanding of the risks and benefits of the intervention.

## Partner Agreements

1. **Definition:** A **Decision Tree** is a model for classification and regression tasks. It consists of a root node, internal nodes, and leaf nodes. The root node branches into internal nodes, which further branch into leaf nodes. The leaf nodes represent the final classification or regression output.

Diagram illustrating the structure of a word, showing the sequence of letters and their corresponding positions in a grid. The word is "Drddrr". The letters are arranged in a sequence of boxes, with the first letter 'D' in a larger box. The positions are numbered 1 through 12, with the 12th position being empty.
