

## Bundled Payments for Care Improvement (BPCI) Advanced Annual Check-in Questionnaire

[illegible]

1

1

### Purpose:

Participants' activities and barriers related to designing and implementing the BPCI Advanced Model

1

### Instructions:

The first part of the study was a pilot study. The purpose of the pilot study was to determine the feasibility of the study and to estimate the sample size required for the main study. The pilot study was conducted with 10 participants. The results of the pilot study showed that the study was feasible and that the sample size required for the main study was 100 participants.

The main study was conducted with 100 participants. The participants were recruited from a local community. The study was conducted over a period of 12 weeks. The participants were assigned to two groups: the experimental group and the control group. The experimental group received the intervention, while the control group did not receive the intervention.

The results of the study showed that the intervention was effective in reducing the risk of cardiovascular disease. The experimental group had a significantly lower risk of cardiovascular disease compared to the control group. The results of the study suggest that the intervention should be implemented on a larger scale.

The study was limited by several factors. First, the study was a pilot study and therefore the results may not be generalizable to a larger population. Second, the study was conducted over a short period of time and therefore the long-term effects of the intervention were not known. Third, the study did not include a blinding procedure and therefore the results may have been biased.

Despite these limitations, the study provides valuable information about the effectiveness of the intervention. The results of the study suggest that the intervention is a promising approach to reducing the risk of cardiovascular disease. Further research is needed to confirm these findings and to determine the long-term effects of the intervention.

The diagram illustrates three DNA sequences represented by boxes. The top sequence consists of 18 boxes, with the first four being white, followed by two pairs of blue boxes, and the last six being white. The middle sequence consists of 19 boxes, starting with five white boxes, followed by a pair of blue boxes, then a series of alternating blue and white boxes, ending with one blue box. The bottom sequence consists of 10 boxes, with the first four being white, followed by a pair of blue boxes, and the last two being white.

## Partner Agreements

1. **Definition:** A **Decision Tree** is a model for classification and regression tasks. It consists of a root node, internal nodes, and leaf nodes. The root node splits the data into two or more subsets based on a feature and a threshold. This process is repeated recursively for each subset, creating a tree structure. The leaf nodes represent the final classification or regression result.
