

## Bundled Payments for Care Improvement (BPCI) Advanced Annual Check-in Questionnaire

[illegible]

1

7

### Purpose:

Participants' activities and barriers related to designing and implementing the BPCI Advanced Model

**Instructions:**

The first part of the study was a pilot study. The purpose of the pilot study was to determine the feasibility of the study and to estimate the sample size required for the main study. The pilot study was conducted with 10 participants. The results of the pilot study showed that the study was feasible and that the sample size required for the main study was 100 participants.

The main study was conducted with 100 participants. The participants were recruited from a local community center. The participants were randomly assigned to two groups: the experimental group and the control group. The experimental group received the intervention, and the control group did not receive the intervention. The intervention was a 12-week program of physical activity and nutrition education. The participants in the experimental group were instructed to engage in 150 minutes of moderate-intensity physical activity per week and to consume a diet that was rich in fruits, vegetables, and whole grains. The participants in the control group were instructed to continue with their current level of physical activity and diet.

The primary outcome of the study was the change in body mass index (BMI) over the 12-week period. The secondary outcomes were the change in waist circumference, blood pressure, and blood glucose levels. The results of the study showed that the participants in the experimental group had a significantly greater reduction in BMI, waist circumference, blood pressure, and blood glucose levels compared to the participants in the control group.

The results of the study suggest that a 12-week program of physical activity and nutrition education can effectively reduce BMI, waist circumference, blood pressure, and blood glucose levels in a community-based population. These findings have important implications for the development of public health interventions aimed at reducing the risk of chronic diseases.

Diagram illustrating the location of the *rrd* gene on the *E. coli* genome. The genome is shown as a circular map with various genes labeled. The *rrd* gene is located on the right side of the map, between the *rrd* and *rrd* genes.

The diagram illustrates the hierarchical assembly of a protein complex. It begins with individual amino acid residues represented by small squares. These assemble into alpha-helices (labeled 'r') and beta-sheets (labeled 'd'). These secondary structures then combine to form a domain (labeled 'M'), which finally assembles into the complete protein complex.
